SCREEN KIT

Lista Mandado on any phone screen

Ready-made pictures of the app's screen, plus a page that resizes the screen to any phone, for filling the blank screen in a generated phone image.

What's in the kit

8 screen pictures: four phone sizes, each in light and dark, at full phone resolution.

A resizable screen page on Claude for any size that isn't covered by the pictures.

A sample shopping trip in English, with 15 items sorted in Walmart aisle order and two items already checked off.

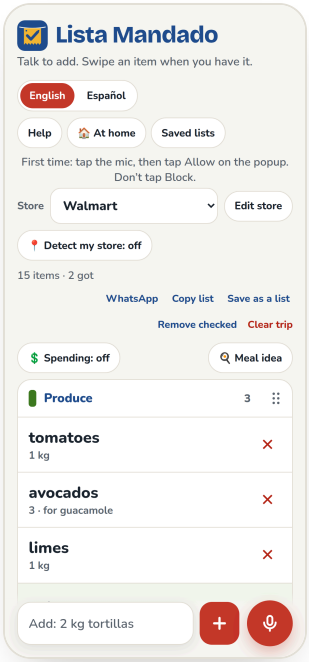

Inside this guide

2 · The light screens 3 · The dark screens
4 · Fitting a screen into your image 5 · Making any other size

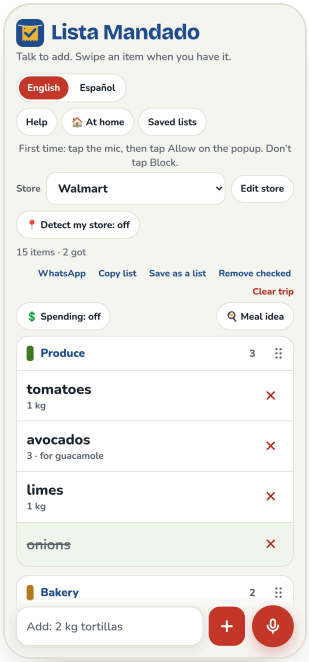

THE PICTURES

Light screens

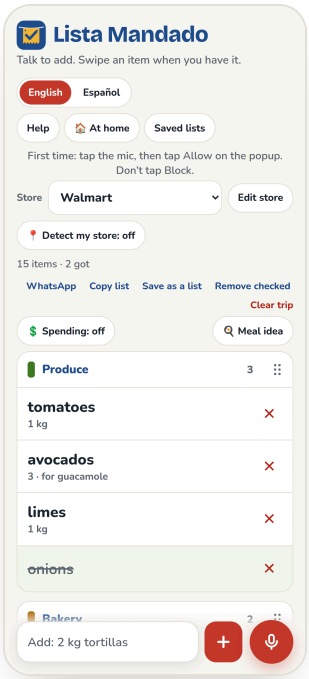

Use these when the image is bright or daytime, or when the phone sits on a light surface. Each picture is the app's full screen at the phone's real resolution, so it stays sharp when you shrink it.

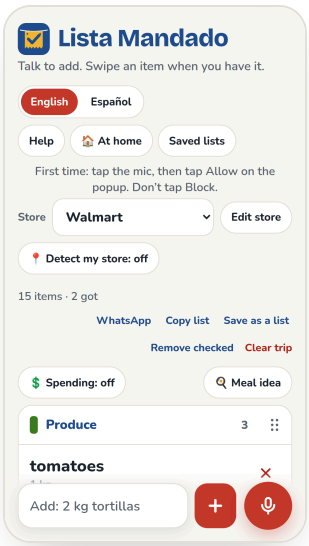

iPhone 15 / 16
1179 × 2556 px
lista-mandado-iphone-15-16-light.png

iPhone Pro Max / Plus
1290 × 2796 px
lista-mandado-iphone-pro-max-light.png

Android
1236 × 2745 px
lista-mandado-android-light.png

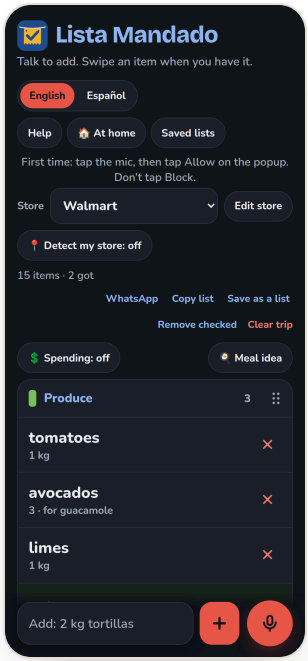

iPhone SE
1125 × 2001 px
lista-mandado-iphone-se-light.png

Which one first? Most phones in AI-generated images look like a recent iPhone. Start with **iPhone 15 / 16**. It's the same shape as the Pro Max, so either one fits those phones.

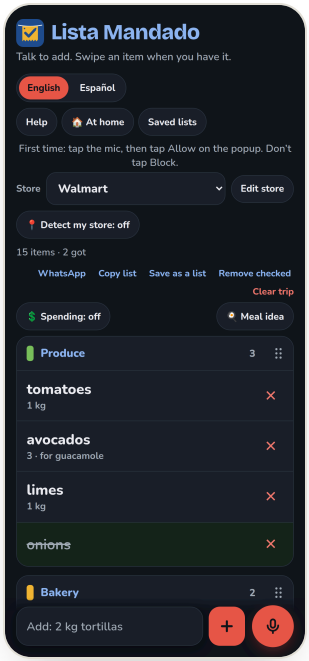

THE PICTURES

Dark screens

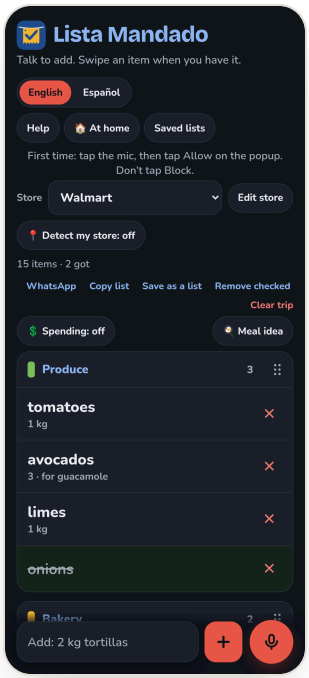

Use these when the scene is at night or in dim light, or when a bright screen would stand out too much. The sizes and items are the same as the light set.

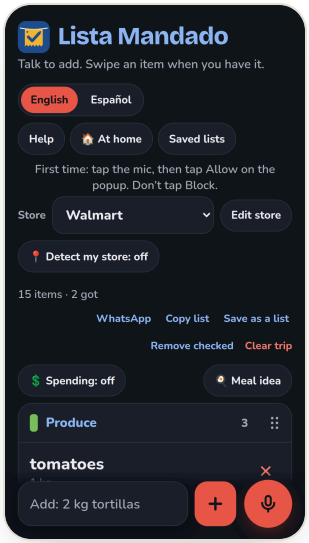

iPhone 15 / 16
1179 × 2556 px

HOW TO

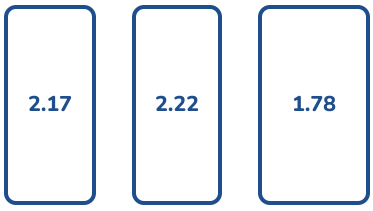

Fitting a screen into your image

A screen picture fits cleanly when it has the same **shape** as the blank screen in your image. Size doesn't matter much, because you can shrink any of these pictures. Shape does matter, because stretching makes the text look squashed.

Find the shape of your blank screen

1. Measure the blank screen in your generated image: its **width** and **height** in pixels. Most photo editors show this when you draw a selection box over it.
2. Divide the height by the width. For example, 600 tall ÷ 276 wide = **2.17**.
3. Pick the picture with the closest number from the table below.
4. Place it over the screen, scale it down until it covers the screen, and keep the shape locked (hold Shift in most editors). If the phone is tilted, use your editor's **perspective** or **distort** tool to pin each corner to a corner of the screen.
5. Round the corners to match the phone, or put the picture under the phone's frame layer so the frame hides the corners.

PICTURE	SIZE IN PIXELS	SHAPE (HEIGHT ÷ WIDTH)	FITS
iPhone 15 / 16	1179 × 2556	**2.17**	iPhone X to 16, most AI phone images
iPhone Pro Max / Plus	1290 × 2796	**2.17**	The big iPhones (same shape, larger)
Android	1236 × 2745	**2.22**	Samsung Galaxy, Google Pixel
iPhone SE	1125 × 2001	**1.78**	Older phones with a home button

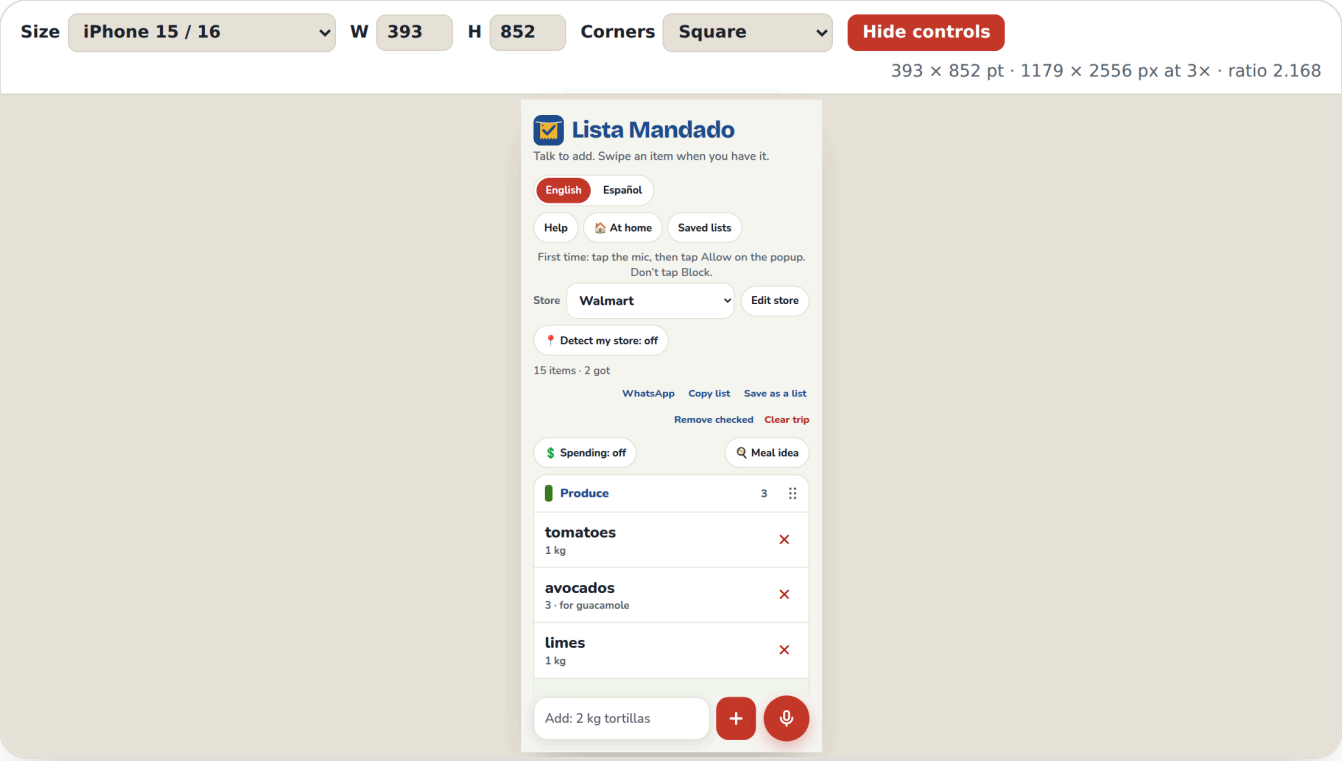

The three shapes, drawn to scale. If your screen is close to one of these (within about 0.03), that picture will fit. If not, make an exact size with the page on the next page.

ANY OTHER SIZE

Making an exact size

When none of the pictures matches, the screen page on Claude can be set to any width and height. It shows the real app with the same sample list.

https://claude.ai/artifact/QaBBX7RBzkWo7hXXjXBkEr

The size bar

Size: pick a phone, or choose Custom.

W and H: type the shape you measured. Any size with the same shape works, so for a 276 × 600 screen you can type `276` and `600`.

Corners: Square, Rounded or Phone-round.

The note on the right shows the shape and the full-resolution size.

Getting the picture

1. Tap **Hide controls** so only the screen shows.
2. Take a screenshot and crop it to the screen.
3. Press **Esc**, or tap the empty space around the screen, to bring the controls back.

The page remembers the last size you set. Only you can open it until you share it from its **Share** menu.

Tip: for a sharper screenshot, make your browser window large and zoom it to 200% before taking the screenshot. The screen scales up with it.
